
C.F. WEBER presents at Techtexsil 2024

NEW CORDURA® 560dtex fabric with butadiene rubber coating for special applications

After a long time, C.F. WEBER GmbH Spitzkunnersdorf can finally offer a fabric solution with butadiene rubber coating on CORDURA® 560dtex again.

"Years ago, there was already a product solution that was very popular with our customers but had to be cancelled for production-related reasons. The newly developed product, which has the same product properties as its predecessor, will be celebrating its big comeback at Techtexsil 2024, where it will be presented to an interested trade audience," - says Sales Manager Tino Dörfel.

The high-strength CORDURA® backing fabric, together with the highly abrasion-resistant butadiene rubber coating and exceptionally good anti-slip effect, is particularly impressive for demanding special applications in a wide range of areas. These range from trim material for highly durable, extremely resilient items of clothing, abrasion protection applications for luggage and bags or anti-slip pads for holster stops in military applications or reinforcement materials for personal rescue equipment.

This new C.F. WEBER product solution can therefore score points wherever the requirements for an extremely hardwearing protective material are very high. Further information will be available at Techtexsil in Frankfurt am Main, in Hall 11.1 at the C.F. WEBER stand C49.
